

The Forensic Coordinates:

This document serves as a predictive addendum to the Planetary Reconstruction Report. It is our conclusion that the major mineral provinces of the Australian continent are not the result of billion-year accumulation which is illogical. Instead, we anticipate through our modeling of the "Engine Room" that all of these deposits represent the Thermodynamic Exhaust of a singular, high-pressure propulsion event. By applying an exponential curve of moving mass and the mechanics of supercritical fluid injection, we predict the following coordinates and target depths where the "elements melted" and reformed.

1. Mount Isa: The Case for Vertical Continuity Current Status:
Decommissioning of copper operations. What we believe is an unrealized opportunity and anticipate a primary copper-gold "feeder" stack located at 20 ° 43 ' 27 " S, 139 ° 28 ' 53 " E. Target Depth: 1,500m – 1,900m. The Logic: Rather than following shale horizons, drilling need align with the Propulsion Vector. The mineralization is a rhythmic pulse that intensifies as you approach the hydraulic source beneath the existing workings.

2. Olympic Dam: The Heart of the Gravity Anomaly Current Status:
Horizontal expansion and low-grade blending. We anticipate a concentrated "Thermodynamic Clot" of maximum metallic density at 30 ° 58 ' 31.3 " S, 137 ° 12 ' 29.4 " E. Target Depth: 800m – 1,000m. The Logic: This is the center of the moving mass. We conclude the 17 mGal anomaly is not diffuse; it is the physical stopping point of the elements. Scrutiny of this specific core will reveal the "Blueprint's" most intense accumulation.

3. Kalgoorlie: The Deep Shear Injection Current Status: Incremental gains in the upper crust. We anticipate a primary injection node at 30 ° 46 ' 29 " S, 121 ° 30 ' 34 " E. Target Depth: 1,400m – 1,800m. The Logic: The gold was pulsed, not leached. We anticipate that grade increases significantly at these depths as the drill intercepts the original pressure relief valve of the Yilgarn Craton.

We offer these coordinates To the respective companies as a challenge to the "Economic Life" projections of the Australian mining sector. We anticipate that a shift from a "Deep Time" perspective to an "Engine Room" perspective will reveal that these mines are not exhausted, but are only now reaching their primary source. Location of the above targets will essentially Verify our Geological position and Science.

.
